

Clinical Furniture and Equipment Inventory Services

A comprehensive inventory supports an on-demand, accurate and detailed view of the status of your F&E and is the foundation of any healthcare asset management system. The information it contains is critical for healthcare planning from strategic levels through to operational maintenance activities and emergency readiness.

Clinical furniture and equipment (F&E) inventories provide detailed lists of assets held by a healthcare facility. Identified by a unique barcode, each asset typically has numerous attributes describing it, such as: manufacturer, model, serial number, location, utilities, a condition assessment and warranty information. To be of the most value, an inventory must be current, complete and accessible.

Strategic Capital Equipment Planning

Item counts, age and condition assessments captured in an F&E inventory are key to planning future equipment investments. Capturing an F&E baseline and tracking inventory changes allows a healthcare facility to develop a replacement and renewal strategy. Proactive planning aids in setting appropriate donation targets and making timely equipment purchases.

How we can help

Inventory Survey Services

We are the Canadian market leader in hospital equipment planning and inventory services. We can quickly establish a new inventory baseline for your healthcare facility using one of these two approaches:

Full Service: Our project management team can supply resources and set up processes to help you streamline your inventory procedures. This includes survey scheduling, file evaluations within the first 40 days of collection, communication templates, health and safety tools, floor signage for sensitive areas, an online performance dashboard for reporting your team's progress, and online access to finalized records with photos.

Self-Perform: With this method, your organization can conduct an inventory survey using our F&E inventory collections mobile application. This app guides users through safe collection protocols and can provide backend office support. The mobile application is customizable, allowing hospital staff to collect asset information specific to their needs. Quality control is built into the app at point of entry and through drop-down menu choices which ensure complete, consistent item naming based on ECRI™ standards.

“As a former senior leader in the hospital sector I can attest to the value of an inventory service to document the current state of clinical assets. In a recent project, hard decisions arose from not having the budget to buy new. By referring to our inventory list, we were quickly able to identify equipment that could be transferred.”

– Deborah Hill RN, BScN, MHA (she/her)
